

DOMAIN 05: ARCHIVE

- **PROTOCOL:** UNsCRYPTED DISASTER RECOVERY
- **SECTOR:** KNOWLEDGE, PRESERVATION & SKILL REGISTRY
- **CLEARANCE:** OVERLORD & ASSIGNED ARCHITECTS ONLY

1. THE LORE MANDATE

You are the memory of the human race. You hold the sum of pre-collapse human knowledge locked in the bunker's cold storage. Without you, the survivors are rebuilding society from the stone age. Your mandate is to structure the massive data banks, preserve the blueprints of the old world, and map the survivor skill registries so the bunker knows who is capable of doing what. If you fail, all history and technical knowledge is permanently erased, and the future is blind.

2. REQUIRED DELIVERABLES (THE OUTPUT)

Your team must successfully engineer and submit the following assets before the deadline. Do not miss a single requirement.

- **[01] The Analog Blueprint (A3 Paper):** A high-level system architecture diagram drawn on paper. *Note: No team member may open a laptop until a Warden verifies and approves this blueprint.*
- **[02] Software Product MVP:** The functional application/codebase that actively handles the bunker's knowledge databases, file retrieval, and survivor skill registry.
- **[03] System Pitch Deck (PPT):** A 5-minute presentation deck designed for the final evaluation, explaining how your system works and why it should be the master architecture.
- **[04] Survivor PR & Rollout Plan:** A strategic plan detailing how you will introduce this archive system to a panicked survivor population and teach them how to access and contribute to the data banks.
- **[05] Folklore Narrative (Separate Document):** A creative document translating your technical utility into human mythology. How will the story of "The Keepers of the Past" be told around the campfire by the next generation?
- **[06] Project Archive (.ZIP):** The final, compiled ZIP file containing all code, decks, and documents for official submission to the Microsoft Core.

3. THE CRITICAL DEPENDENCIES (THE CATCH)

You cannot build your system in a silo. Your Envoy must physically walk to the other sectors to negotiate the following data transfers and integrations.

- **INBOUND DEPENDENCY (What you need to survive):** You are completely isolated in cold storage to protect the data. You **cannot push any data** to the Core or access the active network blindly. Your Envoy must negotiate with **NEXUS** (Governance). They must explicitly verify your access clearances and route your uplinks before your databases can go live.
- **OUTBOUND DEPENDENCY (Who relies on you):** Every other sector in this bunker requires your blueprints to survive long-term. **PULSE** needs your medical archives to treat unknown

diseases. **HARVEST** needs your agricultural data to optimize synthetic soil. You must establish APIs so the rest of the grid can query your preserved knowledge.

4. THE FINAL EVALUATION

At the end of the day, your Sector Overlord will stand before the Council of Elders (the judges) for a strict **5-minute pitch**.

You will present your Pitch Deck (PPT) to explain the functionality of your MVP. Separately, you will present your Folklore Narrative to prove that your technology has a soul. You must convince the Council that ARCHIVE deserves to be the Core Architect of the new world.
